Bennett is a simple utility for analyzing the signal strength of your Bluetooth adapters. It supports a variety of adapters from several manufacturers, including BlueSoleil, FreeBT, Texas Instruments CC2540/41 Development Kit Bluetooth stacks. It is a convenient solution for users who want to keep an eye on the quality of their connection and make sure that their Bluetooth devices are not affected by any interferences. Bennett Benefits: Monitor Bluetooth RSSI signal Analyze Bluetooth adapter manufacturers, adapters and versions Graph and export graphs as pictures Create log files for each device Bennett Characteristics: Works with several adapters No installation required Supports several graphic formats Supports a variety of adapters Supports a variety of graphic formats Modifying your registry: When viewing RSSI graphs, remember to consider the following: The RSSI metric represents the strength of the signal between devices using Bluetooth as a communication protocol. RSSI refers to "received signal strength indicator." Bluetooth devices and devices that use other wireless protocols will not provide this display. The display is a relative measure. It is calculated by the transmitting device and then reported back to the receiving device. The greater the RSSI value, the stronger the signal. The RSSI metric is not a measure of the actual physical distance between two devices. Measurements must be performed on the specified channels supported by the firmware. While RSSI values may be similar across channel sets, they are not identical. Differences are most pronounced when comparing devices from different vendors, with different channel sets and firmware. RSSI values will vary based on the number of client devices connected. RSSI Values Below 0.0 Increase in Value 0.0 0.1 0.3 0.6 0.9 1.2 1.5 1.8 2.1 2.5 2.8 3.2 3.6 4.0 4.4 4.8 5.2 5.6 5.9 6.3 6.7 7.1 7.5 7.9 8.3 8.7 9.1 9.5 9.9 10.3 10.7 11.1 11.5 11.9 12.3 12.7 13.1 RSSI Values Above 40.0 Decrease in Value 47 comments so far
