A practical guide to model design and analysis. system dynamics palm ii solutions manual Paperback. 1. Field of the Invention The invention relates to an anchor, and more particularly to an anti-mildew anchor. 2. Description of Related Art It is known that a picket fence is commonly made of wooden rails disposed in an array of rows and tied together at fence posts using flexible wire. Typically, the wire is configured in a rectangular cross-section, wherein the long dimension of the wire is substantially perpendicular to the picket length, and the wire is held by the fence posts at a 90 degree angle to the picket length. The cross section of the wire is held together at a proper tension to keep the picket fence in a taut position. Wooden picket fences may be treated with a preservative, such as non-peroxide fungicide, to provide protection for the wooden picket from fungi, insects, and mildew, among other microorganisms. Fungi grow on the treated wooden pickets, and may cause a mildew fungus to continue to grow on the picket. Such mildew fungi may corrode the pickets and may eventually dissolve some of the solid picket material to the point where the picket is weakened. Therefore, a need exists for an anti-mildew anchor that is adapted for use with a fence. Q: Using pattern matching with matlab to extract file names I have a large set of files where each have a date on the name, let's say ddmmyyyy\_hhmmss.bmp Where the first 7 characters are the date, the next 7 characters are the time, and bmp is the file name. What I want to do, is get the filename of every file in this directory, and then do some operations based on that. I could have each file be individually stored in a cell in an array, but I'm trying to minimize these calls to the filesystem. At the moment, I'm trying to use the regex function. The thing is, I've never really used regex in matlab before, so I'm a little confused as to how this works. Current code that I'm using: full = fullfile(current, pattern, '\*.\*'); [matches, ext] = regexp(full, '^d{2}\_d{2}\.bmp\$');
