The present invention relates to a method for forming a semiconductor device having a buried bit line, and more particularly, to a method for forming a semiconductor device having a buried bit line by which a deep contact hole is formed in a low height portion of a cell array region of a semiconductor substrate, and then buried bit line is formed in the contact hole. Recently, as the integration density of semiconductor devices has increased, the width of a contact hole is decreased and the aspect ratio of the contact hole has increased. For example, as the integration density of semiconductor devices has increased, the width of the contact hole is decreased and the aspect ratio of the contact hole has increased. A method for forming a buried bit line is disclosed in, e.g., U.S. Pat. No. 5,443,886 and U.S. Pat. No. 5,563,503. In the disclosed method, the buried bit line is formed after a cell array is formed. In particular, after a

storage node is formed in the cell array region, a first interlayer dielectric layer is formed on the cell array region and on the storage node. Then, a cell array region is selectively etched to form a buried contact hole exposing a storage node. Thereafter, a buried bit line contact plug is formed in the buried contact hole, thereby forming a bit line contact. As mentioned above, in the conventional semiconductor device, a buried contact hole is formed by etching a cell array region. Thus, as the integration density of semiconductor devices has increased, the depth of the buried contact hole is decreased, and the aspect ratio of the buried contact hole is increased.

If you are not familiar with his work, LaFeber was an author with an impressive body of scholarship, ranging from his monumental Vietnam to Cuba to the Cold War, and from his co-written book on Kennedy with Daniel Schorr to his books on American foreign policy, this encyclopaedic subject. What made LaFeber's work of such importance is that he was, as he put it, "an intellectual who saw everything and went everywhere." LaFeber was born in 1922, grew up in New York, attended Harvard and taught at Cornell. He also held senior positions at the Foreign Service Institute in Washington and at the Institute for International Studies in New York. He died in December 2006. There were two books that he wrote that appeared on the New York Times best-seller list. The first was a history of the Cold War in which he focused on the American

Police in Canada say they've arrested a suspect in connection with the murder of two Canadian hikers last year.

Federal police in Toronto said Saturday that they've arrested 55-year-old Jean-Pierre Lebrun, who faces two counts of first-degree murder. The bodies of Chynna de Pasquale and her boyfriend Nick Mazzolai, both 24, were found Feb. 18, 2018, in a remote area of British Columbia near their home in Golden, British Columbia. Both were stabbed to death. Mazzolai's body was found inside a tent. De Pasquale was found close to his body. Lebrun was arrested in April in front of Toronto's Pearson International Airport. He was granted bail and is scheduled to return to court next month. Lebrun was also charged with the murders of Canadian journalist Colten Boushie in August 2016, and farmer Maurice Vey on July 4 of the same year. The British Columbia double murder remains unsolved.

Q: How to rotate a PDF file in Java without creating a duplicate file? I'm trying to rotate a PDF file within my Java application. I've come across this question, which links to a piece of code in Java that solves the problem of rotating a PDF file without creating a duplicate file. However, I'm having difficulty implementing this method into my application. I want to be able to rotate a PDF file through a GUI in the way that I can do with normal PDF files, which I'd expect to be something like: PDDocument document = PDDocument.load(new File("C:/Users/Auser/Desktop/test.pdf")); document.setPage(5, 5, page); public void pageTurn() { PDFont font = PDType1Font.TIMES_ROMAN;
