To create artwork in Photoshop, select a layer, then choose an option in the top right corner of the window: Image > Adjust > Auto Levels or Image > Adjust > Levels. Alternatively, in the Layers palette, double-click the layer to open the Levels dialog box. In the dialog box, double-click a histogram, and then increase or decrease the upper left and lower right sections to emphasize image areas you want to brighten and darken. (The settings remain in effect for the current layer only. This is called a *layer mask.* You can select the layer mask icon and drag it over the areas you want to brighten or darken.) Once you've applied the Levels settings, you can create a clone of the layer by selecting Layer » Duplicate Layer or Layer » Duplicate Layer Adjustments. Cloning layers gives you more flexibility to modify details of images that are standardized by layers. You can separate the result into a number of identical layers and can continue to modify the individual layers individually. Your art is expressed as millions of pixels. Most of the time, those pixels are grouped into a single image, and the pixels within the image are related to one another, defining an image. (This process is called *compression*.) Ordinarily, when you show your artwork on a computer screen, or when you save it to file, all of the pixels are presented as a single square. (This process is called *rasterizing*.) When you modify an image in Photoshop, you have to understand pixels with some degree of precision. For example, you may modify a single pixel that is within the boundary of a pair of eyes in order to affect other parts of the image. 933d7f57e6
