The new back button, shown top left, is a small but welcome innovation in the tablet apps. The button brings up the last panel you had open, but if you're already on a different page you can just tap through it to return to the previous panel. A strength of Photoshop CC is that it keeps a trace of any action you've just completed, so you can return to a previous panel and process it again as many times as you like; the "Undo" button (bottom left) lets you undo any file-wide changes you've made. That same button, and one that lets you redo any thing you've done, are now also front and center. The new ability to view layers as seperate panels means you can keep an eye on whether your customizations, as you'll do with color corrections, has been saved in the document. Go back and forth between layers, or double click to see them both at once. All of these panels can be resized or dragged to different size. Overall, I absolutely love this update to the desktop apps. For us that use them on all of our devices, this update is extremely important. I have tested over 50 different tablet apps and platforms for review and they all have their own issues. Adobe has addressed all the issues that I have ever had in using Photoshop on a computer and tablet. Newer photoshop fans that have never used a tablet before is a great update for everyone. We get it on every platform which is great. At the end of the day these designers are a creative bunch and want the very best tools to improve their results. This update in photoshop does that well.
